CHO-SHIELD® 2040
ELECTRICALLY CONDUCTIVE SILVER ACRYLIC EMI COATING

Customer Value Proposition:
CHO-SHIELD® 2040 is an electrically conductive, one-component silver-filled acrylic coating that is specially formulated for application on plastics to provide premium EMI/RFI shielding performance. The coating’s robust formulation can be applied in both high and low volume paint application processes.

CHO-SHIELD 2040 is ideal for use on electronic enclosures and assemblies. The coating’s composition allows for simple, standard application using conventional equipment with minimal dry-time and handling.

CHO-SHIELD 2040 is ideal for use on medical electronic enclosures and assemblies which require high level, reliable EMI shielding performance and may benefit from silver’s antimicrobial properties.

CHO-SHIELD 2040 conductive coating provides superior performance for a variety of applications, including:
- Superior EMI shielding (see shielding effectiveness curve Fig. 1)
- Anti-static protection
- Surface grounding

Contact Information:

Features and Benefits:
- One component
- Thermoplastic acrylic
- Silver flake filler
- Excellent-leveling, Wets and covers surfaces smoothly
- Easy to use. CHO-SHIELD 2040 is supplied at 40 weight % solids and can be thinned to a suitable spraying viscosity with MEK solvent. The coating can be applied with standard spray paint equipment, no expensive capital equipment required.
- Material dries at room temperature—no high temperature cure required, fast throughput. Good adhesion to a variety of plastics. Durable coating.
- Superior conductivity and EMI shielding. Silver coating has antimicrobial properties which make it a good material choice for hospital environments.
- Provides great coverage at thin dry film thickness which minimizes material costs and reduces paint cycle time.
**Application**

**Recommended Preparation**

1. **Clean the substrate:**
The substrate surface should be clean, dry and free of oils, release agents, dirt and lint.

2. **Mix the material:**
CHO-SHIELD 2040 is supplied at 40 weight% solids and should be thinned using MEK (Methyl Ethyl Ketone) to a suitable viscosity for application with your specific spray equipment.

Chomerics recommends the material be sprayed at approximately 30% solids (CHO-SHIELD 2040 may be sprayed at slightly higher or slightly lower weight % solids depending upon your equipment). Table 1 below shows the approximate weight of solvent which should be added to the CHO-SHIELD 2040 to achieve the corresponding weight % solids.

**Table 1: Thinning of CS 2040 for Application**

<table>
<thead>
<tr>
<th>CS 2040 Weight % Solids</th>
<th>Weight of MEK per gallon of CS 2040 (grams)</th>
<th>Weight of MEK per quart of CS 2040 (grams)</th>
<th>Weight of MEK per 100 grams of CS 2040 (grams)</th>
</tr>
</thead>
<tbody>

When spraying CHO-SHIELD 2040 in a humid environment (R.H. > 50%), retard blushing by substituting 200 grams of n-butanol (also called n-butyl alcohol CAS# 71-36-3) for MEK per gallon of CHO-SHIELD 2040 before spraying.

3. **After thinning with solvent, mix the material well by placing the can on a paint shaker for 3-4 minutes or mix by hand with a large spatula until all solids are in a homogeneous suspension.** Check that no unmixed material remains on the bottom or the sides of the container.

4. **Optional: Strain the material to reduce or eliminate the potential for clogging the spray nozzle.** The paint can be strained through a course mesh (1000 micron) flat strainer into a pressure pot for spray. All metal fillers should be transferred, although a small amount of filler clusters might be collected in the strainer.

**Fluid Delivery System**

Use a pressure pot (15 psi, 103 kPa, typical) with large diameter, paddle-type agitator at low mixing speed to keep the metal fillers in uniform suspension.

Conventional spray equipment such as HVLP (High Volume, Low Pressure) or DeVilbiss EGA 503 with propeller agitator pressure pots may be used for spray application with approximately 20-50 psi (138-345 kPa) atomizing air. Use lowest possible pressure. Re-circulation of the paint from the mixing pot through the spray gun and back via a pump delivery system is recommended for greater filler uniformity.

For large volume applications, a robotic spray system with an HLVP spray gun should be used to minimize material loss due to overspray and maximize paint transfer efficiency. Siphon feed equipment can be used for small or prototype runs.

**Drying Conditions**

1. **Dry at room temperature for 10-20 minutes.**

2. **Continue drying at 150°F ± 10°F (65°C ± 5.5°C) for 30 minutes for 0.001 inches (25 µm, 1 mil) thickness.**

Dry longer if thicker film, shorter if thinner film, to achieve desired conductivity.

**Note:** Drying at room temperature for 24 hours will achieve similar performance.

**Spray Gun and Pressure**

Use a standard HVLP spray gun with approximately 20-40 psi (138-276 kPa) atomizing air.

A fluid nozzle with a minimum orifice diameter of 0.040 (1.016) is recommended.

To obtain maximum adhesion and conductivity, dry spraying should be avoided. Adjust the spray pressure to achieve a proper wet film when applying the conductive coating.

**Nominal Dry Film Thickness**

A nominal dry film thickness of 0.001 inches (25 µm, 1 mil) is recommended to obtain 80 dB shielding effectiveness. However, a thinner or thicker coat may be acceptable depending on the shielding requirements of the device being protected.

Allow material to dry 10-20 minutes at room temperature between coats to avoid solvent entrapment.

**Clean-up**

The spray system, including spray gun, mixing pot, and containers can be cleaned with MEK or Acetone [VOC exempt solvent]. Masks can be power-washed with Challenge 485S barrier coat.

**Storage and Handling**

CHO-SHIELD 2040 should be stored at 50ºF to 86ºF (10ºC to 30ºC) and has a 12 month shelf life from the date of manufacturing in the original sealed container. CHO-SHIELD 2040 is a flammable liquid. Please consult the material safety data sheet for proper handling procedures before use.
